RESEARCH ACTIVITY

M.L. Di Gioia research activity is based on the structural modification of natural amino acids and the synthesis of their non-natural analogues to obtain peptidomimetics with potential pharmacological activity. The main modifications concern the *N*-methylation of the amine function of amino acids and oligopeptides, the modification of the peptide skeleton contemplating, at the same time, the possibility of introduction and removal of the main protective groups used in organic chemistry. More recently her research interests have focused on sustainable chemistry and on the use of unconventional solvents for the development of synthetic processes with low environmental impact for the production of biomolecules useful in the pharmaceutical and biomedical fields. In particular, the focus in this research area is on deep eutectic solvents (DESSs), as promising new generation green reaction media, for the development of sustainable chemistry in peptide synthesis and for the extraction of active ingredients from natural matrices.
